Olubusayo Ladelokun

4.1) Any computer worm that operates without human intervention is likely to either be self-defeating or inherently detectable because
 a.)The system registry helps the worm to propagate
 b.) When worms needs to create entry in system registry.

4.6) It can be stopped through RSA fingerprint of a compiler or tool. Users can use RSA fingerprint to verify its identity. It would have the same fingerprint if the the compiler were to come from that of an original website/ repository.
