Internet of things is about the communication and analyzation of technology. Internet of things was created from the idea of technology communicating with humans and other technology with no human help. This idea or concept has been broad and affected in our daily activities today. Internet of things has affect our lives through the development of sensors, Wifi, Car parking, etc.

Companies have come intact with this idea of advancing their business.IOT uses data collection to achieve its goal by analyzing data collected. IOT has implemented businesses in such a way that it collected data of customers and their requirement to analyze what type of product they need for their satisfaction. IOT is much more business friendly because it is saves money, communicates clearer and also gives the business/ company control and automation. In today's world data analytics is of high demand. With its help, IOT is used to develop software and devices needed for the future.
